Smoke house

► How do you build a burnout motor to last? John Pilla knows

NOT everyone loves burnouts but the huge prize money on offer is evidence that there's never been such overwhelming enthusiasm for the sport as there is now.

While there are many good machine shops and engine builders in Australia, the guys at Powerhouse Engines in Victoria do it all in-house and have their logo on some of the biggest hitters – the likes of Peter Grmusa's EVILXA, Mick Brasher's ULEGAL and Steve Loader's UCSMOKE and UNLOAD.

Not only are the cars tough performers but when you take a look at the big-cube, hard-revving combinations, it's hard not to be impressed with how well they run given the torture tests they are repeatedly subjected to.

Building a 500ci, high-revving big-block that can sing at full noise for three minutes without any load on it is one hell of an accomplishment – it's easier to junk an engine that's revving without load than one that's loaded to the eyeballs.

Powerhouse chief engine builder John Pilla is the small guy behind some big cars and we

caught up with him recently, and asked how Powerhouse got started.

"In 2006, after 12 years of working at various machine shops, I decided to do my own thing. We started small and rapidly grew through word of mouth. I have never had a sign outside the factory and I don't think I ever will.

"The burnout thing started off with Leroy Rees and the BIGV8 Statesman. I became best mates with his son, James, who had been doing the work on his dad's car, and gave them a hand with the freshen-up of the old engine.

John with the dry-sumped 477ci monster he's building for Mick Brasher's new car

"James taught me what he had learnt about blown-alcohol stuff on BIGV8 and also his own car, ITS253 [a Commodore wagon with an aspirated 253] and I just went from there. A short time later, I started doing the engines for Steve Loader on UCSMOKE and it went from there.

"You can't build this kind of motor for just anybody; I need to choose the customer – one with a good car, who knows how to maintain the engine."

So what are the rules for using an engine like this? "They need to heat the oil and I'd prefer that the engine has a rev limiter. Steve Loader didn't have

a rev limiter in his motor for years and if you have good throttle control you don't need one. Some say it's not good to have this type of engine bouncing off the limiter but Leroy glues his foot to the floor for the whole burnout and hasn't hurt it.

"I like to see them back at the shop after 50 burnouts. In the interim the owner needs to look at the filter, run the tappets and, on a blown motor, tighten the intake manifold bolts regularly."

As for warranty: "If one ever lunched on the dyno before the customer got it, I'd wear it. But once the customer has it, I can't control the way the motor is

BINGO!

A RECENT private track hire in Sydney saw the Bingo 10.5 car run a 6.48@220mph off the trailer. While the 6.48 was impressive, Sam Fenech was beaming about the eighth-mile numbers – 4.26@176mph. The other standout of the day was Victorian Steve Athans, who managed a personal best 7.1@201.5mph, smashing his previous best of 7.39sec. The 572ci, twin-turbo Mustang recently got a new transmission, and TCE modded the Yankee converter before the car hit the track with 29lb of boost. With a good handle on the engine tune now, it's shouldn't be long before we see this car closer to the 6.80s.

FAB & DANDY

DANDY Engines has recently taken delivery of a new XW Falcon that has previously been extensively overhauled by Profab Engineering in Wollongong. The 429ci, CHI-headed motor is currently being built with twin Pro Mod 88 turbos, while Eric Gillard, owner of Proline Engines in the USA, will be heading Down Under later this year to have a steer in what is potentially the fastest radial car in Australia.

TRULY MAD!

THE MRMAD Torana of Sydneysider Ivan Tesic is undergoing a major refit at Street Car Fabrications. Formerly running a twin-turbo SBC that pushed the car into the 6.70s, it's getting a Moran-built 640ci big-block Chev with twin 91mm Precision turbos. "The small-block was quite fragile," Craig Burns says, "and the manual trans needed to be cooled down between rounds. This new deal with the auto, should make the power with ease, and need minimal maintenance." The old motor made around 2000hp; these big-blocks are good for 3000hp, so the car should make 6.40-6.50s at a jog.

used so it's difficult to put warranty on that. It's the same for any race-style engine.

"The oiling system – especially on a wet sump motor turning to 9000rpm – will never live without attention. I recommend a quality 20-50 multigrade mineral oil with plenty of bearing clearance, rather than tight clearances like a Japanese engine.

"Engine oil temperature is another big one; no engine will live if the oil is 400 degrees.

"Valvetrain is everything; the engine is under no load so it's critical to match the valve springs, retainers, locks and pushrods to the cam profile and revs. We also modify the barrel valve on the injected cars as you can often have the motor at 8000rpm with the butterflies shut, so the motor isn't getting any air.

"Boost also equates to heat. I try to keep the motors at 12-16lb, though they rarely make boost during a burnout as they are never under any load.

"Components don't need to be the best that money can buy but they do need to be quality."

So how come he hasn't been able to talk more guys out of the big-cube motors and into smaller, higher-revving combinations?

"Everyone thinks bigger is better. Mick Brasher is the only guy who listens to me on that. His new motor is 3.750in stroke and 4.5in bore – perfect!"

What direction do you see the sport taking? "LS1-style motors are flooding the scene but the direction is 10,000-plus rpm. People all have different budgets but this and wilder driving is where it's heading, without a doubt." 

ABOVE: John likes to tune engines with the full exhaust system that will be used on the car, instead of dyno pipes, so he modified his Super Flow dyno with stepped in legs on the frame. Simple!
